# An introduction to polymer physics

Wentao Hao

College of Chemical Engineering Hefei University of Technology

### 5. Transition AND relaxation

- 5.1 Introduction
- ~10 hours
- 5.2 Glass transition
- 5.3 Factors affecting glass transition
- 5.4 Molecular motion in glass state polymer
- 5.5 Molecular motion in crystalline polymer

Wentao Hao, Hefei University of Technology

# 5.1 introduction What will happen when temperature or action time changes? Wentao Hao, Hefei University of Technology

# Why temperature or action time

have so much effect on the physical properties of polymer material?

Because of the long, chain like structure.

Wentao Hao, Hefei University of Technology

Thermal transition of linear amorphous polymer

Two transitions Three states Key point

strain

Glass state viscosityFlow state

T<sub>g</sub> T<sub>r</sub> temperature

Fig. 5-1 strain-temperature curve for amorphous polymer

Wentao Hao, Hefei University of Technology 5

# (a) Glass state

- 1. crystalline solids: molecules are ordered in a regular lattice
- fluids: molecules are disordered and are not rigidly bound.
- 3. glasses: molecules are disordered but are rigidly bound.

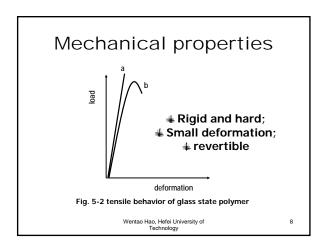

Movement of large motion units are frozen

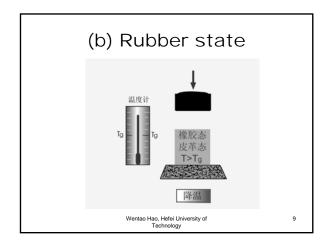

How large?

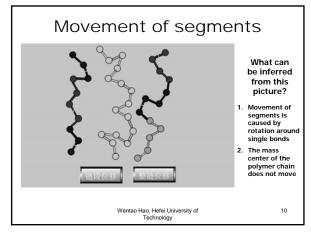

\$ 08000

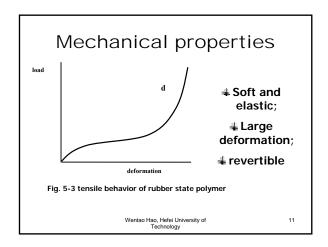

Wentao Hao, Hefei University of Technology

# Motion units 1. Length and angle of covalent bonds 2. Smaller units – side groups, branched chains..... Poly her shains? Wentao Hao, Hefei University of Technology 7

	Modulus (Pa)	strain
Glass state	10 <sup>10</sup> -10 <sup>12</sup>	0.01 - 0.1%
rubber state	10 <sup>5</sup> - 10 <sup>7</sup>	100 – 1000%

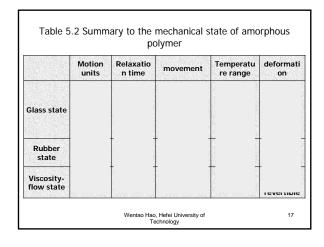

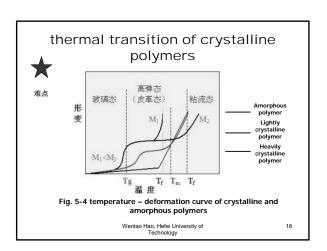

# Viscosity-flow state

- **↓**Motion of whole molecular chains being activated
- **∔Slippage of chain happens under stress**
- **<b>♣**Deformation is unrecoverable

Wentao Hao, Hefei University of Technology 15

### **SUMMARY** TgRubber Viscosity-flow Glass state state state Different motion state Attention: 1. mechanical states ≠ Different deformation ability the thermal dynamic Different mechanical state 2. Tg and Tf $\neq$ the phase transition temperature **Different properties** Wentao Hao, Hefei University of Technology

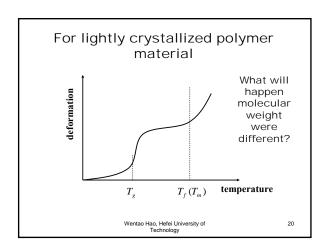

For amorphous polymer material with different molecular weight

• 3 states and 2 transitions

• Higher molecular weight, higher  $T_f$  due to the entanglement of molecules and the stronger interactions  $T_g$   $T_r$   $T_r$   $T_r$   $T_r$   $T_r$   $T_r$ 

# For lightly crystallized polymer material

Wentao Hao, Hefei University of Technology 19

21

23

Q1. Does crystallization affect the transition?

NO, there are still 2 transitions and 3 states.  $T_g$  is also obvious.

obvious.

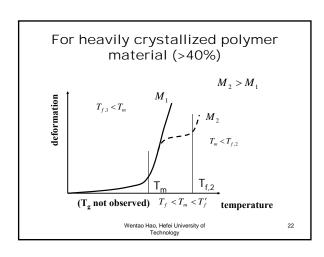

Q2. For small molecular weight material, at which temperature it will transfer into viscosity-state?

 $T_m,\, T_m\!\!>\!\! T_f,\, At\, T_f\, it\, will\, remaining\, in\, rubber\, state.$  Crystals are like physical cross-linker.

Q3. For large molecular weight material, at which temperature it will transfer into viscosity-state?

T<sub>f</sub>. T<sub>r</sub>>T<sub>m</sub>. After crystals being melted, molecules still can not move violently due to strong interactions among the molecules.

Wentao Hao, Hefei University of Technology

# For heavily crystallized polymer material (>40%)

Q1. Why there is no glass transition?

□ Crystallites form continuous phases.
 □ Motion of Polymer chains is restricted.
 □ Glass transition disappears.

Q2. For small molecular weight material, at which temperature it will transfer into viscosity-state?

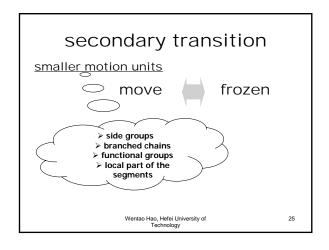

## T<sub>m</sub>. No rubber state.

Q3. For large molecular weight material, at which temperature it will transfer into viscosity-state?

T<sub>f</sub>. Has Rubber state.

Wentao Hao, Hefei University of Technology

For different molecular weight Crystals Crystallized Amorphous polymer destroyed state Low crystallinity glass state → rubber state → viscosity flow state High crystallinity molecular glass state → viscosity-Viscosity-flow state (low molecular weight) flow state Rubber state → viscosity-flow state (melt) Viscosity-Rubber flow state Hiah state weight Wentao Hao, Hefei University of Technology 24

As we know, polycarbonate (聚碳酸酯) has rigid structure. Why it can be made into feeding-bottles (奶瓶)?

What is the primary transition?

Wentao Hao, Hefei University of Technology

Yes Wentao Hao, Hefei University of Technology

- Primary transition is usually refer to the glass transition
  - Primary Motion units are larger
  - Secondary Motion units are smaller

What is the largest motion unit?

The molecular chain

Wentao Hao, Hefei University of Technology 27

### features of molecular motion

A. Variety (of motion units)

Key point

- B. Time-dependent
- C. Temperature-dependent

Wentao Hao, Hefei University of Technology 28

### Table 5.2 Variety of motion units

motion units	Motion	Macro performance	features
Whole molecular chains	Movement of chains	Flow, crystallization	The mass center moves
Segments (long and short)	Movement of segments	Transfer from glass state to elastomer state	The mass center does not move
Side groups and branched chains	Rotation of side groups, vibration etc	Can not be observed	restricted in small range

Wentao Hao, Hefei University of Technology

### B. Time-dependence

- ALL the molecular motion of polymers are time-dependent – RELAXATION
- What is RELAXTION
  - Motion units of Polymer transfer from one balance state to another by adjusting themselves

Wentao Hao, Hefei University of Technology

### (a) Relaxation of PVC string (丝) $\Delta x_0$ – the original length $\Delta x(t) = \Delta x_0 e^{-t/\tau}$ $\Delta x(t)$ – the length at $\Delta x(t)$ $\tau$ -- constant, being called relaxation time $t = \tau$ , $\Delta x(t) = \Delta x_0/e$ $\Delta x_0/e$ τ为常数,不是 恒等量,对每个 体系均不同 Figure 5-5 relaxation of PVC string 《高分子物理》, p225 Wentao Hao, Hefei University of Technology 31

# Questions arise After the stress is released, the molecules tend to come back from extended state to coil-like state. (why?)

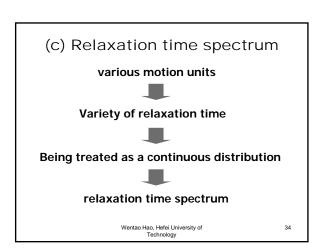

Why the string can not shrink back immediately? 收缩

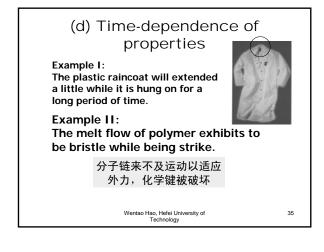

· where does the hindrance come from? 阻力

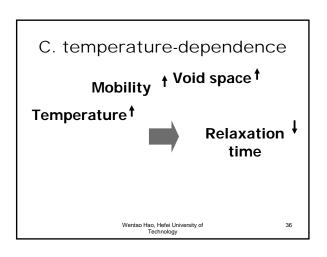

Wentao Hao, Hefei University of Technology

32

### (b) Relaxation time Relaxation time $\tau$ is a physical parameter to describe the relaxation speed τ→ 0, relaxed very quickly Example: $H_2O \dot{10}^{-9} - 10^{-10} s$ $\tau \rightarrow \infty$ , relaxed very slowly Example: years 33 Wentao Hao, Hefei University of Technology

# (a) Eyring equation

For small motion units, like side groups or branched chains

$$au = au_0 e^{rac{\Delta E}{RT}}$$
  $\mathbf{T}^{\uparrow}$ ,  $\mathbf{\tau}^{\downarrow}$ 

 $τ_0$  - constant; R - gas constant

ΔE - activation energy needed for relaxation

Wentao Hao, Hefei University of Technology

## (b) WLF equation

For large motion units, like segments

$$\ln\left(\frac{\tau}{\tau_s}\right) = -\frac{C_1(T - T_s)}{C_2 + (T - T_s)}$$

 $C_1$ ,  $C_2$  are constant, s – reference  $T^{\uparrow}$ ,  $\tau^{\downarrow}$ 

Wentao Hao, Hefei University of Technology

## 5.2 Glass transition

Key Point

37

- In general, amorphous polymers change from hard, brittle, 'glassy' materials at low temperatures to soft, deformable, rubbery materials at high temperatures.
- This is known as the 'glass transition' and occurs over a relatively narrow range of temperatures characterised by the glass transition temperature,  $T_{a}$

定义: 指非晶态高聚物从玻璃态到高弹态的转变。 对晶态高分子来说,玻璃化转变是指其中非晶部 分的这种转变。

Wentao Hao, Hefei University of Technology

# Meaning of T<sub>a</sub>

- That some liquids were solidified to glassy state without crystallization when being cooled was called glass transition.
- The corresponding temperature was called Glass transition temperature, as  $T_{q}$ .
- For non-crystalline polymer, it was referred to the transition temperature from rubbery to glassy when being cooled; also the temperature from glassy to rubbery when being heated.

Wentao Hao, Hefei University of Technology

40

# Technical importance of T<sub>a</sub>

- •It is the upper application temperature of non-crystalline plastics, like PS, PMMA or hard **PVC**
- •It is the lower application temperature of non-crystalline rubber, like NR, SBR etc

Wentao Hao, Hefei University of Technology

41

# Theoretical importance of T<sub>a</sub>

>To characterize the molecular flexibility >Important feature of polymers

高聚物刚性因子越 大,玻璃化转变温度 越

高

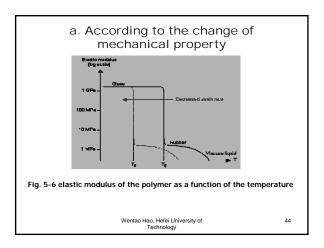

低

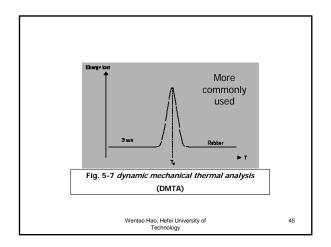

Wentao Hao, Hefei University of Technology

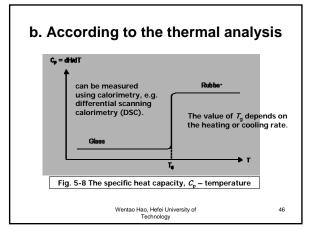

# 5.2.1 how to determine $T_q$

 In general, all the properties that will change apparently during glass transition can be used to determine the glass transition temperature

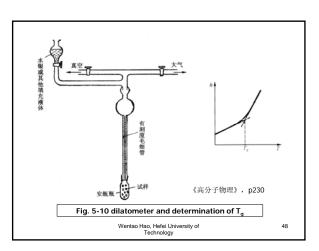

> Wentao Hao, Hefei University of Technology

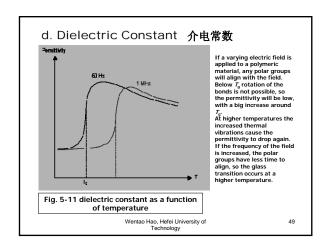

### Important!

- T<sub>g</sub> obtained from different methods are usually not the same!
- It is not a phase transition temperature, so that it will be different as testing methods varies.
- As we use them, the testing methods and testing conditions must be mentioned.

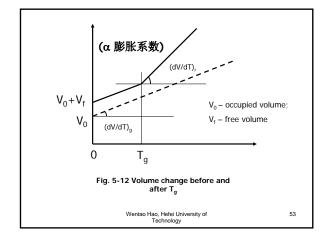

Wentao Hao, Hefei University of Technology 50

# 5.2.2 free volume theory 1. concept Whole volume Cocupied volume Free volumes are distributed in the whole material as void space for the segments to change conformation First proposed by Fox and Flory

### 2. Description of free volume theory

- · In glass state
  - Movement of segments is frozen
  - Free volume is frozen too, to be a fixed value
  - Size and distribution of Void space are no longer changeable
  - Tg is a critical temperature
  - Under such a temperature there is no extra free space for molecules to adjust their conformation
  - It is a state of constant free volume

Wentao Hao, Hefei University of Technology 52

- $\bullet \ \ Under \ T_{g_f} \ in \ glass \ state$ 
  - Volume expansion is just expansion of molecule themselves
  - Including increment of vibration and bonds length
- At T<sub>g</sub>
  - Segments get enough energy, space expanded too, begin to move
- Beyond T<sub>g</sub>, in rubber state
  - Except for the volume expansion of molecules, free volume expands too
  - α<sub>r</sub> > α<sub>g</sub>, (α 膨胀系数)

Wentao Hao, Hefei University of Technology

### 3. more details about free volume theory

The whole volume of polymer at T<sub>a</sub>

The whole volume of polymer over T<sub>a</sub>

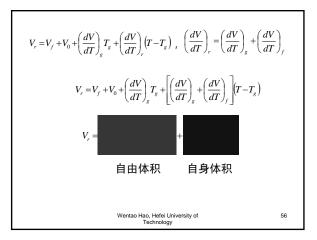

$$V_g = V_f + V_0 + \left(\frac{dV}{dT}\right)_a T_g$$

55

V<sub>f</sub> - the free volume of polymer in glass state

the volume of polymer occupied in 0 K

Wentao Hao, Hefei University of Technology

$$\begin{split} (V_f)_\tau &= V_f + \left(\frac{dV}{dT}\right)_f (T - T_g) \\ &= V_f + \left[\left(\frac{dV}{dT}\right)_r - \left(\frac{dV}{dT}\right)_g\right] \!\! \left(T - T_g\right) \\ \text{Around } T_g, & \frac{\left(V_f\right)_T}{V_g} = \frac{V_f}{V_g} + \frac{1}{V_g} \!\! \left[\left(\frac{dV}{dT}\right)_r - \left(\frac{dV}{dT}\right)_g\right] \!\! \left(T - T_g\right) \\ \text{That is,} & f_T &= f_g + \left(\alpha_r - \alpha_g\right) \!\! \left(T - T_g\right) \\ &= f_g + \Delta\alpha \! \left(T - T_g\right) \end{split}$$
 or 
$$f_T &= f_g + \alpha_f \left(T - T_g\right) \end{split}$$

Wentao Hao, Hefei University of Technology

5.2.3 WLF equation - talking more

$$\lg \frac{\eta(T)}{\eta(T_g)} = -\frac{17.44(T - T_g)}{51.6 + (T - T_g)}$$

 $\eta(T)$  – viscosity of polymer at T

 $\eta(T_q)$  – viscosity of polymer at  $T_q$ 

Wentao Hao, Hefei University of Technology

58

$$\eta = A \exp \left(BV_0 / V_f\right) \qquad \text{Doolittle Equation}$$
 
$$\ln \eta(T) = \ln A + B \frac{V_0(T)}{V_f(T)} \quad \ln \eta(T_g) = \ln A + B \frac{V_0(T_g)}{V_f(T_g)}$$
 
$$\ln \frac{\eta(T)}{\eta(T_g)} = B \left[\frac{V_0(T)}{V_f(T)} - \frac{V_0(T_g)}{V_f(T_g)}\right]$$

Wentao Hao, Hefei University of Technology

According to the concept of 
$$f_T$$
 
$$f_T = \frac{V_f(T)}{V_0(T) + V_f(T)} \approx \frac{V_f(T)}{V_0(T)}$$

$$\lim \frac{\eta(T)}{\eta(T_g)} = B \left[ \frac{1}{f_T} - \frac{1}{f_g} \right]$$

$$\lg \frac{\eta(T)}{\eta(T_g)} = \frac{-B}{2.303 f_g} \frac{T - T_g}{\frac{f_g}{\alpha_f} + (T - T_g)}$$
Wentao Hao, Hefei University of 60

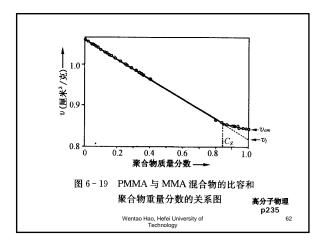

Wentao Hao, Hefei University of Technology

Wentao Hao, Hefei University of Technology

61

63

65

- 聚甲基丙烯酸甲酯(高分子固体)与甲基丙烯酸甲酯(小分子液体)—相似又不同
- (本) 一怕以人小同 混合物比体积随聚合物浓度提高而降低,但在较高浓度下,混合物的 粘度变得很大,聚合物的链段不再能自由运动 由于这种冻结,非晶态聚合物的比体积大于同一温度下外推得到的比 体积
- 自由体积可以定义为

$$f_{WLF} = \frac{v_{am} - v_l}{v_{am}}$$

实验测得 $\nu_{\mu}$ =0.842cm $^3$ /g, $\nu_{\ell}$ =0.820cm $^3$ /g,因而聚甲基丙烯酸甲酯的自由体积分数为0.026,等于2.6%,与WLF方程预言的自由体积分数很接近

Wentao Hao, Hefei University of Technology

# 5.3 Factors affecting $T_g$

- 5.3.1 Chemical structures
- 5.3.2 Other factors
- · 5.3.3 environmental factors

Wentao Hao, Hefei University of Technology

64

**Key point** 

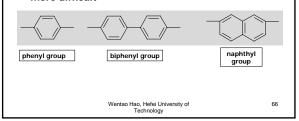

### 5.3.1 Chemical structures A. main chain structure

- A<sub>1</sub> saturated bonds
  - Flexibility: -C-C- < -C-O- < -Si-O-
  - Rotate easily, T<sub>g</sub>
  - PE: -68 ℃; POM: -83 ℃; PDMS: -123 ℃
  - The more flexible, the lower the T<sub>a</sub>

Wentao Hao, Hefei University of Technology

### 5.3.1 Chemical structures. A. main chain structure

- A<sub>2</sub> Introduction of phenyl group, biphenyl group, naphthyl group (萘基) will increase the Tq
- Molecular chain turns to be rigid, rotation is more difficult

# 5.3.1 Chemical structures. A. main chain structure

- · A<sub>3</sub> isolated double bonds
  - Flexible, T<sub>a</sub> is low
    - Natural rubber: T<sub>q</sub> = -73 ℃
    - cis-PB, -108℃; trans, -83℃
    - cis-polyisoprene, -73°C; trans, Tg = -60°C
    - By the way, Trans-polyisoprene is more likely to compact together and form ordered structure

Wentao Hao, Hefei University of Technology 67

69

71

### 

# 5.3.1 Chemical structures B. stereo-hindrance of substitutes

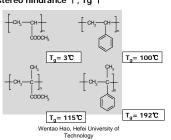

• B2. For polyacenaphthylene(聚苊烯)

- Rotation is hindered seriously, T<sub>a</sub> reaches 264 ℃

Wentao Hao, Hefei University of Technology

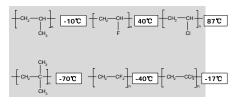

# 5.3.1 Chemical structures B. stereo-hindrance of substitutes

B<sub>3</sub>. For -(CH<sub>2</sub>-CXY)<sub>n</sub>-,
 X ≠ Y, stereo hindrance †, Tg †

# 5.3.1 Chemical structures B. stereo-hindrance of substitutes

- B<sub>4</sub>. For –(CH<sub>2</sub>-CXY)<sub>n</sub>-,
  - X = Y, stereo hindrance  $\downarrow$ , even less than single bond rotation barrier, T<sub>g</sub>  $\downarrow$

Wentao Hao, Hefei University of Technology

# 5.3.1 Chemical structures C. the length of side chains

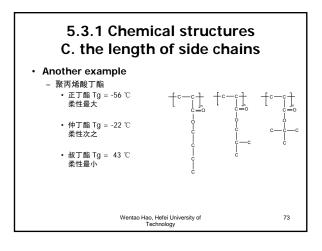

- Important! with the length of side chains  $^{\uparrow}$ ,  $T_{g\,\downarrow}$
- For PAA series(聚丙烯酸酯系列)

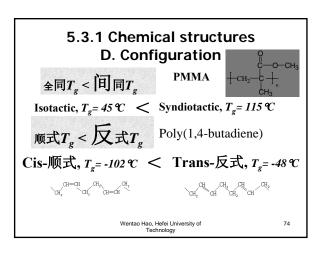

(111 17 ) (111 17 )								
n	1	2	3	4	6	8	12	18
T <sub>g</sub> (℃)	105	65	35	21	-5	-20	-65	-100

- The longer the side chains, the flexible of side chains, and the lower the  $\mathsf{T}_\mathsf{g}$
- In fact, side chains function as plasticizing agent (增塑剂)

《高分子物理》, p245

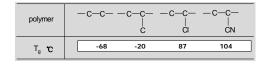

Wentao Hao, Hefei University of Technology 72

### 5.3.1 Chemical structures E. interaction between polymer chains

- · Polarity of side chains
  - The higher the polarity, the higher the  $T_{\rm q}$

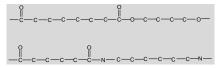

Wentao Hao, Hefei University of Technology

75

77

### 5.3.1 Chemical structures E. interaction between polymer chains

- · H-bonds
  - 聚辛二酸丁二酯 VS. 尼龙66

- 原子总数目相同, $T_g$  不同,氢键作用
- -57°C ↔ +50°C

Wentao Hao, Hefei University of Technology

### 5.3.1 Chemical structures F. effect of ion on polyelectrolyte

- Addition of ion into polyelectrolyte, such as polyacrylic acid, will increase the Tg remarkably
  - Addition of Na+, T $_{\rm g}$  106  $^{\circ}{
    m C} 
    ightarrow$  280  $^{\circ}{
    m C}$

Wentao Hao, Hefei University of Technology

# 5.3.1 Chemical structures

G.  $T_m$  and  $T_q$ 

- · For symmetrical polymer
  - $T_q/T_m \approx 1/2$
- · For non-symmetrical polymer
  - $\star$  T<sub>g</sub>/T<sub>m</sub>  $\approx$  2/3
- · Kelvin temperature scale!

Wentao Hao, Hefei University of Technology

78

# Table 5.6 approximate relationship between $T_{\rm m}$ and $T_{\rm q}$ for some typical polymers

polymer	T <sub>m</sub> ℃	$T_{g\;(calculated)}$	T <sub>g (experimental)</sub>
Nylon-6	225 (498K)	59 (332K)	50
PET	267 (540K)	87 (360K)	69
PE	137 (410K)	-68 (205K)	-68
PVDC	198 (471K)	-37.5 (235.5K)	-17

Wentao Hao, Hefei University of Technology 79

T<sub>g</sub> of PVC

78

50

29

3

-16

-30

81

83

# 5.3.2 other factors

A. plasticizer (plasticizing agent)

 Plasticizing is to make polymer soften by adding small molecules into it.

Example – adding / diethyl phthalate to PVC

Wentao Hao, Hefei University of Technology

# 5.3.2 other factors A. plasticizer (plasticizing agent)

- · 常见PVC增塑剂品种
  - 邻苯二甲酸二丁酯 (DBP)
  - 邻苯二甲酸二辛酯 (DOP)
  - 癸二甲酸二辛酯
  - 磷酸三苯酯
  - 磷酸三甲酚酯
  - 一磷酸三甲酚酯一烷基磺酸苯酯
- 10 20 30

Content of DOP

n

40

45

Wentao Hao, Hefei University of Technology

### 5.3.2 other factors

A. plasticizer (plasticizing agent)

- · Effect of plasticizer
  - enlarge the space between polymer chains (SO WHAT?)
  - inactivate the polar substitutes
  - In summary lower the T<sub>g</sub> of polymers

Wentao Hao, Hefei University of Technology 82

80

# 5.3.2 other factors B. copolymerization

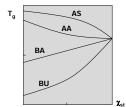

Fig. 5-17  $T_{\rm g}$  of styrene copolymers VS. content of styrene

Wentao Hao, Hefei University of Technology

### 5.3.2 other factors

B. copolymerization

- Effect of copolymerization continuously change of  $T_{\alpha}$  of copolymer
- · For random copolymer
- One  $T_g$  available

$$\frac{1}{T_{e}} = \frac{W_{A}}{T_{eA}} + \frac{W_{B}}{T_{eB}}$$

Wentao Hao, Hefei University of Technology

### 5.3.2 other factors

B. copolymerization

- · For alternative copolymer
- -A-B-A-B-A-B-A-B-
- · Can be seen as -(AB)-(AB)-(AB)-(AB)-
- Only one T<sub>g</sub> available

Wentao Hao, Hefei University of Technology

85

### 5.3.2 other factors

B. copolymerization

- · For block copolymer
  - -AAAAA-BBBBBBB-AAAAA-
- There are two phases formed by A segments and B segments
  - If the two phases are compatible, then only one  $\rm T_{\rm g}$ appears
  - If the two phases are not compatible, then two Tg appears (phase separation can be observed)

Wentao Hao, Hefei University of Technology

86

# 5.3.2 other factors

B. copolymerization

- In fact,  $T_{\rm g}$  appearing or not depends on the size of phase formed by the polymer chain segments
- If the phase size is large enough, movement of segments can be detected, then  $\mathbf{T}_{\mathbf{g}}$  can be observed
- On the other hand,  $T_{\rm g}$  can not be observed
- · Such a conclusion is suitable for blends too.

Wentao Hao, Hefei University of Technology

87

### 5.3.2 other factors

C. crosslinking

- . In general, crosslinking will restrict the movement of segments
- And it will raise  $T_g$  of original polymer

Table 5.8 Content of Diethyl-benzene on the Tg of crosslinked styrene copolymer

Diethyl-benzene %	Tg (℃)	Average chain links between two crosslinking points
0	87	-
0.6	89.5	172
0.8	92	101
1.0	94.5	92
1.5	97	58
	Wentao Hao, Hefei University of	

Wentao Hao, Hefei University of Technology

### 5.3.2 other factors D. molecular weight

The lower the molecular weight is, the more the chain ends will

Free space around the chain ends is larger than that around the middle parts of polymer

Lower molecular weight will result in lower  $T_g$ 

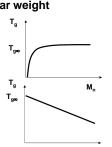

Fig. 5-18 effect of 1/M<sub>n</sub> molecular weight on Tg

Wentao Hao, Hefei University of Technology

### 5.3.3 environmental factors A. heating rate

 Heating rate or Cooling rate ↑, apparent T<sub>g</sub> ↑

· Heating rate or Cooling rate <sup>↓</sup>, apparent T<sub>a</sub> <sup>↓</sup>

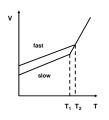

Fig. 5-19 effect of heating/cooling rate on Tg

Wentao Hao, Hefei University of Technology

# 5.3.3 environmental factors B. exogenic forces

- $\bullet$  Exogenic forces will force the segments to move, so that  $T_{\rm q}$  will be lowered.
  - As PVC was under tensile force of 200 kg/cm², T $_{\rm g}$  was lowered from 78  $^{\circ}{\rm C}$  to 50  $^{\circ}{\rm C}.$
- 外力作用降低了链段运动势能位垒,从而使链段活动能力增强,玻璃化转变温度降低(强迫高弹形变现象)

Wentao Hao, Hefei University of Technology 91

93

# 5.3.3 environmental factorsC. surrounding pressure

- Surrounding pressure will lower the free volume and increase the motion hindrance
- Need more energy input to make the segments move
- And will increase T<sub>g</sub>
- 压力会增加链段运动位垒,需要更多热量,更高温度才能实现链段运动

Wentao Hao, Hefei University of Technology 92

# 5.4 molecular motion of glass state polymer

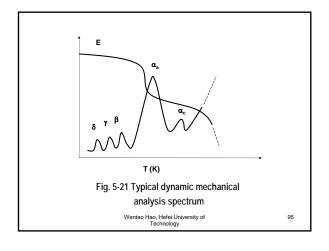

- secondary molecular motions in glass state polymer.
  - Motion of chain links (链节)
  - Rotation of side groups

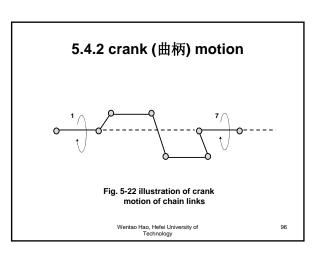

Motion inside side groups

Wentao Hao, Hefei University of Technology A. Chain links
B. Rotation of side groups
C. Motion inside the side groups
Fig. 5-20 examples of motion units causing secondary transition

Wentao Hao, Hefei University of Technology

94

### 5.4.3 motion of non-carbon atoms

- It means that the relaxation is caused by amido groups (酰胺基)

Wentao Hao, Hefei University of Technology Chains

• A. rotation of large side groups

- PS

- PMMA
• β-relaxation

Wentao Hao, Hefei University of Technology

98

5.4.4 motion of side groups or side

# 

# 5.4.4 motion of side groups or side chains B. Crank motion of long side chains ( CH<sub>2</sub> ≥4)

# 5.4.4 motion of side groups or side chains

- $\blacksquare$  C. Motion of  $\alpha\text{-methyl}$  groups
- γ-relaxation
- For PMMA, -173°C, DMA (1Hz)

101

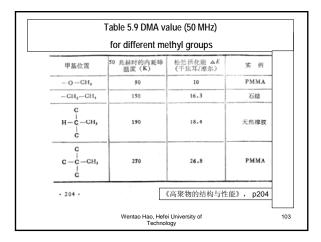

Wentao Hao, Hefei University of Technology

# 5.4.4 motion of side groups or side chains

Wentao Hao, Hefei University of Technology

- D. Motion of the other methyl groups
  - In PMMA, rotation of -CH<sub>3</sub> group in -COOCH<sub>3</sub>,
  - δ relaxation peak
    - Very low test frequency, 4K, no extremum (极值)
    - 10<sup>4</sup> Hz, 6K
  - 50 MHz, 90K
- Higher frequency used, higher transition temperature observed

Wentao Hao, Hefei University of Technology 102

# 5.5 molecular motion of crystalline polymers

 Although the segments of polymers are restricted in the crystalline regions, there are still some kinds of molecular motion available.

> Wentao Hao, Hefei University of Technology

104

# 5.5 molecular motion of crystalline polymers

- For small molecules, crystalline structure is very stable, molecular motion is vibration of atoms at their equilibrium position
- · For polymers, it is quite different.
  - Molecular motion in the non-crystalline region is like that of non-crystalline material, but affected by crystalline region
  - Various molecular motion patterns available inside the crystalline region

Wentao Hao, Hefei University of Technology 105

• It refers to the viscosity-flow transition of polymers

• Molecule moves as a whole, it flows

• Some structural factors will affect  $T_m$ • Interaction or intra-action of molecules will affect the value of  $\Delta H$ • Flexibility will affect the value of  $\Delta S$ Wentao Hao, Hefei University of 106

### 5.5.2 conversion of crystalline pattern

- Under T<sub>m</sub>, crystallites can change crystalline pattern from one to another one
- For polypropylene,  $\alpha \leftrightarrow \beta \leftrightarrow \gamma$  is available under some certain circumstance
  - $-\gamma$  crystallites are obtained under pressure, but is not stable
  - When heating to 150°C,  $\gamma$  crystallites will turn to  $\alpha$  crystallites spontaneously

Wentao Hao, Hefei University of 107 Technology

# 5.5.3 double $T_g$ phenomenon

- Notice!
  - It is different from the double T<sub>g</sub> phenomenon observed in blends of non-compatible polymers
    - Which is related to the super-molecular structures (phase separation)

Wentao Hao, Hefei University of Technology 109

# 5.5.4 motion inside the crystalline region

- Caused by the molecular motion of defects inside the crystalline region
- · or by side groups
- Or maybe by interaction between crystalline region and amorphous region (need more evidence)

Wentao Hao, Hefei University of Technology
